* NOTE: This record contains 1 individual into sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.

* However, it should not be assumed this clone will be sequenced to completion. In the event that the record is updated, the accession number will
CP 5706 91057 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr - Web: www.genoscope.cns.fr)
The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant. The library was produced in an oriented direction, in the pBSII vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó

* NOTE: This record contains 1 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence Sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
                          ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

Novel proteins, termed Exo proteins, have been identified that interact with known exocytosis-associated proteins such as GS27, alpha

/note= "No start codon, stop codons given within
sequence."
                    Expropreting and their agonists and antagonists are useful in the diagnosis, treatment or prevention of exocytosis-mediated disorders such as asthma, inflammation, allergies, Chediak-Higashi Syndrome (CHS), Alzheimer's disease, Parkinson's disease, Huntington's disease, Intenders, digestion disorders and wound healing disorders. The nucleic acids, antagonists or agonists of Exo proteins are useful in gene therapy. The nucleic acids are also useful for generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

expressed sequence tags (EST's) and are used in a 3' RACE (rapid expressed sequence tags (EST's) and are used in a 3' RACE (rapid mapplification of CDNA ends) reaction to amplify the novel ligand-binding receptor, Zcytor2, from humans and macaques. Zcytor2 is a receptor for cytokines (particularly interleukin-13) expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility.

Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention relates to chimeric proteins comprising the human Klotho protein fused to a human immunoglobulin (ABB1691-B11694), and to DNA sequences encoding them (AAA61542-A61545). It also relates to gene therapy vectors comprising DNA encoding the chimeric proteins of the invention, to detection and assay of molecules which interact with Klotho, to antibodies raised against the chimeric protein and to a chimeric protein sof the invention have antiarthritic and nephrotropic activity, and may be used for the treatment, prevention and diagnosis of disorders with which Klotho is associated, including kidney disease, cedema (dropsy) and arthritis. Sequences AAA61557 represent PCR primers used in an exemplification of the invention to generate and alpha chain and the hinge and part of the CH2 domain of the human Ig64 (immunoglobulin G4) heavy chain.
                                                                      Chimeric polypeptide containing klotho protein bound to an immunoglobulin for treatment and prevention of kidney disease, dropsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hemopoletin receptor protein family NR8 used for diagnosis of blood formation disorders - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
                                                                                                                                                                                                                                                                                                        The probe AAV27166 and primers AAV27167-V27168 were used in a method of the invention to isolate NR6 a novel haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers,

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensize, patentity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                        McCarthy JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytokine receptor; ligand binding; testicular cell; spermatogenesis; infertility; antagonist; contraceptive; diagnostic; therapeutic;

                                                                                                                                                                                                                                                                       ö
haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNYTGGAGY encoding the amino acid sequence Trp-Ser. Tha sequences AAZ59258-259300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the amino acid sequence Trp-Ser-Xaa-Trp-Ser.                haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence TFP-Ser. The sequences AAZ59258-259300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Haemopoietin receptor; cell proliferation; cell differentiation; cancer;

NAME OF THE PROOF OF THE PROOF

```
The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZS9258-229300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                    Hemopoietin receptor protein family NR8 used for diagnosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hemopoietin receptor protein family NR8 used for diagnosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of sequences encoding human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAASSQSB-229300 and AASQ016-299025 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially yearched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ5928-259300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hemopoletin receptor protein family \ensuremath{\mathsf{NRR}} used for diagnosis of blood formation disorders -

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

Marker stSG67529 (Primer A : AAAAGTGAAAGAGGGAAAGG; Primer B :
AAAACCCAACGGATGG; amplimer size : 141 bp) was developed from a
Single pass sequencing read from H.sapiens flow-sorted chromosome
9-12 random shear fragment, SC9-12pJ10F12. Vector : pUC18 Site :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                chicken.

This genomic DNA sequence is a fragment of the Mycobacterium fortiutum plasmid pAL 5000 which contains ORF2. This sequence is used in a method which results in the formation of Mycobacterium recombinant vaccines from compositions that provide a continuous source of protein to an animal and stimulate cellular immunity. Such compositions are used to stimulate cellular immunity (by inducing Th-1 cells or cytotoxic T lymphocytes), particularly as vaccines (live or dead) for treating and preventing diseases caused by intracellular pathogens (bacteria, viruses, rickettsia or protozoa), and also cancer, autoimmune diseases, allergy or downers spongiform encephalitis, in humans or animals. The vaccines are administered by injection, orally and masally. These compositions provide consistent and long-lasting immunity. Transformed cells used in method are retained within macrophages, blocking the killing methods may be included in the presented by the macrophage. Several immunogen may be included in the same vaccine and the Mycobacterium cells serve as adjuvant.
                                                                                                                                                                                                                                                  Recombinant non-pathogenic Mycobacterium as vaccines providing long term cellular immunity - useful against intracellular pathogens, cancer and autoimmune disease, and are retained in host macrophages

The splice variant was initially detected during the morula to blastocyst transition stage of a human embryo. The splicing event removes the exon coding for the transmembrane domain causing a frameshift resulting in a novel C-terminus (see AAR94575). The splice variant gpl30 antegonises the action of certain growth factors and can be used to ensure correct development of preimplantation embryos, partic. for in vitro fertilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New splice variant of gpl30 lacking the trans-membrane domain -useful as an antagonist for growth factors esp. for ensuring correct development of pre-implantation embryos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 1977;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The gene encoding human CNTFR was subcloned into bacterial expression vector pCP110. The resulting plasmid, pRPN151, encoded a recombinant, mature form of human CNTFR. Further manipulation of the coding region optimized expression of the gene in E. coll RFJ26, allowing production of useful amounts

                                              antinflammatory; antibocterial; antivital; antifungal; antirheumatic; antifinammatory; antibocterial; antivital; antifungal; antirheumatic; antifinammatory; and antianemic. The sequences can be used for determining pathological conditions associated with an OREX-associated disorder. The nucleic acids can be used to express OREX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

CNTF has been cloned and syntheisized in eukaryotic as well as bacterial expression systems, as described in International Application No. PCT/U.S. 90/05241. The CNTF receptor (CNTFR or CNTFR or alpha) has been cloned and expressed in eukaryotic cells, as described in U.S. Patent Application Serial No. 07/700,677 and International Application No. PCT/US91/03896, filed June 3, 1991. The present invention relates to a stable CNTF/receptor complex which possesses a different mobility in native polyacrylamide gels than either purified fractions of CNTF or CNTFR.
                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                             Sequence encoding human ciliary neurotrophic factor receptor (CNTF).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA sequences (AAT66164 and AAT66165) respectively code for novel mouse and human haemoprotein receptors (AAW09821 and AAW09822) designated NR4 that comprise the interleukin-13 (IL-13) receptor alpha-chain. To obtain the mouse sequence (genomic DNA prepd. from embryonal stem cells was screened with oligonucleotides encoding an amino acid sequence (WSDWS) found in many haemoprotein receptors. The genomic clone was used isolate NR4 cDNA clones from WEHI-3B cells, peritoneal macrophage, bone marrow, skin and kidney libraries, and a composite sequence for mouse NR4 was produced. The availability of genetic sequences for NR4 permits the development of a range of

                                                                  Auto-antigen from synovial cells of rheumatoid arthritis patients binds to antibodies present in these patients, for diagnosis and prediction of the disease
                                                                                                                                     auto-antigen clone A, which can be used to diagnose and predict the development of RA by reaction with antibodies in biological specimens, e.g. sera, from patients.

RNA was isolated from synovial cells from a RA patient and used to construct a cDNA library. This was screened using IgG separated from the synovial fluid of a RA patient. Active clones were isolated in a cloning vector, and inserted into an expression vector for the transformation of E. coli NM522. Transformatis on culture express clone A peptide and follistatin related protein
                                                                                                                                                                                                                                                                                                      ;

AAT35138 encodes a human protein of a ligand binding region of a G-CSF (granulocyte colony stimulating factor) receptor. The DNA and protein are used in the development and/or study of drugs which can be substituted for G-CSF. Such drugs are useful in the treatment of leukaemia resulting from granulocyte over-proliferation. The DNA may be expressed recombinantly to provide a high yield of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Survival and/or proliferation of corticospinal neurons or neurons in the subependymal zone in a patient are promoted by administration of recombinant ciliary neurtrophic factor. The protein may be used to treat a wide range of neurological diseases, e.g haemorrhage, tumor, trauma, infection, Alzheimer's disease, Creuzfeld Jokob disease, Down's syndrome, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ciliary neutrophic factor; neurological disease; haemorrhage; tumor; trauma; infection; Alzheimer's disease; Creuzfeld Jakob disease; Down's syndrome; central nervous system; ds.

This sequence represents the C-terminal domain of a ligand binding region of a human granulocyte colony stimulating factor (G-CSF) receptor. This sequence, the corresponding mouse sequence (see AAT33515) or a conserved fragment of both these sequences (see AAT33517) or an expression vector for the production of the receptor. The sequences can also be used in an expression vector containing E-coli maltose binding protein to produce a fusion protein. The DNA can be used in the study of diseases related to the interaction between the G-CSF receptor and its ligand, as well as for the treatment or prevention of G-CSF receptor ligand-binding region produced, is physiologically active and can be used in the study of the G-CSF receptor, such as analysis of its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       92.0%; Score 13.8; DB 17; Length 639; 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method (A) of inducing differentiation of a bone marrow stromal progenitor cell to an osteoblastic lineage is new and comprises contacting the bone marrow stromal progenitor cell with an amount of leptin or its analog. The products of the invention have osteopathic activity. The method is useful for inducing differentiation of a bone marrow stromal progenitor cell to an osteoblastic lineage and for inducing bone formation in mammals. Therefore the method is useful for the treatment of osteoporosis and other conditions where bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        formation is required. This sequence represents a PCR primer used in the
